## [1] 0.04226727

The regression shows health infrastructure parameters to be more significant with drinking water being the most salient and basic sanitization and clean technnology and fuel use also being significant at the 95% confidence level. Obesity is significant at the 99% confidence level. The training and test errors are impressive at only 4.20% and 4.23% respectively.

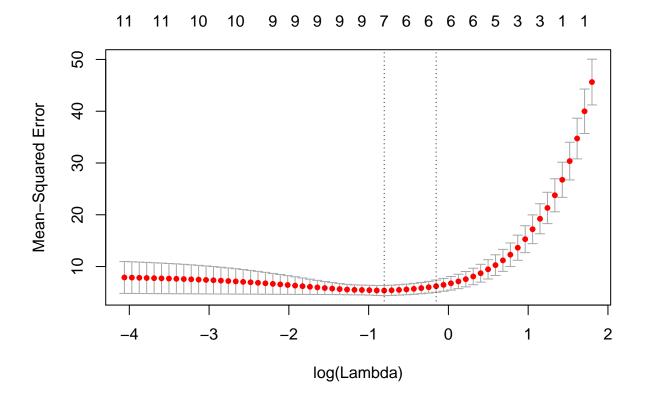

#### LASSO

#### For HALE

```
trainlasso<-trainfullNA

##	0.0000000000	-0.0668166536	-0.0026865670	0.000000000

The provision of Drinking water and Sanitization facilities are having a positive effect on HALE among Health Infrastructures. On the negative side, the population dying due to poisoning, which could be linked to prevalent toxicity and thus indirectly to infrastructure is relevant. Poisoning could also be linked to health behaviours. Among health behaviours, only high BMI has an impact, a negative impact on HALE. Tobacco and Alcohol are suppressed to zero values. Tuberculosis, Cancer and other non-communicable diseases, infant mortality, and neonatal mortality have an inverse relaionship with HALE.

LASSO results do not show any difference in factors affecting HALE and Life expectancy at birth.

```

The provision of Drinking water and Sanitization facilities are having an effect among Health Infrastructures. On the negative side, the population dying due to poisoning, which could be linked to prevalent toxicity and thus indirectly to infrastructure is relevant. Poisoning could also be linked to health behaviours. Among health behaviours, high BMI has a negative impact on life expectancy. Tobacco is relevant as per Lasso but it surprisingly is positively related, likely an anomalous result. Alcohol has no effect. Tuberculosis, Cancer and other non-communicable diseases, infant mortality, and neonatal mortality have an inverse relaionship with life expectancy.

Drinking water, sanitization and access to Clean fuel and technologies have strong positive effects on life expectancy and HAle while high BMI and to bacco have negative effects. The negative impact of obesity is almost as high as the postive impact of drinking water.

```

PCA1 explains most of the variance but the results are not useful as they are spread among too many parameters. Lasso has provided us better results previously.

#The lowest error rate is at cost of 0.75
```

The training and test error rates fall in similar ranges and are slightly lower for HALE than Life Expectancy. At less than 4.5%, the prediction performance is good.

#### Using SVM for Health Behaviours

#The lowest error rate is at cost of 0.01

Training error rate for Health Behaviours was worse than for health infrastructure. HALE was predicted far more accurately at 6.97% and 6.38% error rates for training and test sets respectively. Life expectancy was predicted slightly less accurately at 7.15% and 6.65% error rates.

#### SVM For both health behaviours and health infrastructure
